

DevOps / SRE Challenge!

Here is a minimal flask app:

<https://flask.palletsprojects.com/en/1.1.x/quickstart/#a-minimal-application>

The Task:

Deploy the minimal flask app using Infrastructure as Code (IAC) technologies of your choosing into an Amazon Web Services account.

The task is intentionally open ended because we want to see your resourcefulness of scoping out the task.

Please make a list of your assumptions when completing the task to justify the approach you end up following.

Some points for consideration:

- What service level agreements are required for the application?
- What will the release cycle look like?
- Who are the end users of the application?
- What security/access roles should be implemented?

Please time box this task and be sure to write up any outstanding points as we can discuss these on the demo call where you will be expected to present your work.

Please submit your work in the form of a public git repo.

Good Luck!
